

Reno Five-Age Sensitivity Report

Model lock: Expanded HHVBP, CY2025 performance / CY2027 payment, measure set CY2025 (version locked).

Validation boundary: Public-data-only, expert-configured, semi-synthetic, simulation-based, and not outcome-validated.

These results describe configured model scenarios. They do not establish real-world clinical effects, payment effects, or a uniquely best assignment policy.

Design

This is the dedicated age sensitivity, so age is intentionally varied across all five configured groups. All factors other than age are fixed at health_status=moderate, house_price_zip=average, area_type=metropolitan, housing_type=single_home, distance_to_clinic=near, and driving_condition=good_summer.

The Reno label supplies context only. No patient assignment ZIP is set and no clinician ZIP-history routing is applied.

Aggregate need and reference percentile

Age group	rho raw	u percentile	Strict 0.75 classification
age_40_50	0.233	0.084	at_or_below_pilot_threshold
age_50_60	0.268	0.124	at_or_below_pilot_threshold
age_60_70	0.309	0.197	at_or_below_pilot_threshold
age_70_80	0.358	0.299	at_or_below_pilot_threshold
age_80_plus	0.406	0.413	at_or_below_pilot_threshold

Reliability affects distribution uncertainty in the configured analytic model. The current assignment uses mean need, so uncertainty alone does not change routing.
